

Product Data

50RHR,50RVR 50RHS,50RVS Horizontal and Vertical Aquazone™ Water Source Heat Pumps

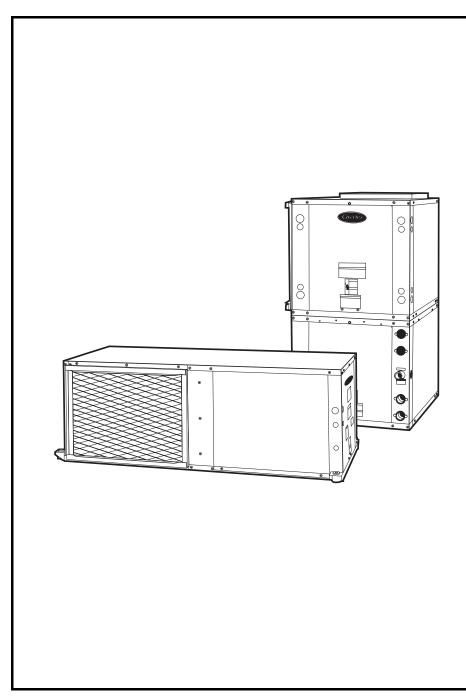

1/2 to 6 Nominal Tons

Carrier's Aquazone™ single-packaged horizontal and vertical water source heat pumps are available in standard and high efficiency configurations. Carrier provides the optimum balance between maintaining occupant comfort conditions, high product quality, low energy utilization, and a flexible water source heat pump design that is user friendly to both system designers and service personnel. Aquazone units are characterized by:

- Efficient water-cooled equipment provided as an integral part of systems designed for energy efficiency and year-round cooling and heating flexibility
- Ideal application for office buildings, hotels/motels, apartments, condominiums, schools, universities, and hospitals
- Utilizes decentralized system concept, which provides for individual zone conditioning for maintaining and controlling comfort conditions
- Available for use with standard and extended entering water temperatures to accommodate closed-loop and open-loop boiler/tower and geothermal applications
- Extensive offerings assist with design specifics through the provision of various airflow configurations, high efficiency capability, sound attenuation package, choice of water heat exchanger, and selection of complete or deluxe controllers

Features/Benefits

Operating efficiency

Carrier horizontal and vertical water source heat pumps are designed for quality and high performance over a lifetime of operation. Standard efficiency models offer cooling EER's to 13.3 and heating COP's to 4.6. High efficiency models offer cooling EER's to 16.0 and heating COP's to 5.3. All efficiencies stated are in accordance with standard conditions under ISO (International Organization for Standardization) Standard 13256-1 and provide among the highest ratings in the industry, exceeding ASHRAE (American Society of Heating, Refrigerant and Air Conditioning Engineers) 90.1 Energy Standards.

High quality construction and testing

All units are manufactured to meet extensive quality control protocol from start to finish through an automated control system, which provides continuous monitoring of each unit and performs quality control checks as equipment progresses through the production process. Standard construction features of the Carrier Aquazone™ units include:

Cabinet — Standard unit fabrication consists of heavy gage galvanized sheet metal cabinet construction designed for part standardization (i.e., minimal number of parts) and modular design. Cabinet interior surfaces are lined with $^{1}/_{2}$ in. thick, $1^{1}/_{2}$ lb. acoustic type insulation. Sheet metal surfaces are treated for maximum corrosion protection to ensure resilience for long term vitality. Compact cabinet dimensions are designed to fit tight space limitations in both horizontal and vertical configurations.

Compressor — Standard efficiency units include a rotary compressor design in size 006 through 024, reciprocating compressor in sizes 019 through 048, and scroll compressor in size 060. High efficiency models offer a rotary compressor design in 015 through 036 sizes and scroll compressor design for sizes 042 through 070. Compressor isolating springs are specially selected for each compressor size. The external springs are mounted on an isolated railing system (i.e., from the cabinet) that maximizes vibration isolation and minimizes transmission to the unit structure.

Blower and motor assembly —

Permanent split capacitor (PSC) threespeed blowers are provided with all units to satisfy many air distribution applications including an upgrade in certain sizes for high static conditions and fan speed control to accommodate reduced sound operation and dehumidification control with the correct controller option. Blower motors are designed to operate at lower temperatures to help improve the reliability of the water source heat pump.

Refrigeration/water circuit —

Units have a sealed refrigerant circuit including a rotary, reciprocating, or scroll compressor. Refrigerant circuits are provided with a standard thermostatic expansion valve (TXV) for higher accuracy and performance. Also standard are a reversing valve (4-way valve), water-to-refrigerant coaxial (tube in tube) coil, and enhanced aluminum fin/rifled copper tube air to refrigerant heat exchanger coil. High efficiency units are provided with larger air to refrigerant coils for combined ultra high efficiency.

ARI/ISO — Aquazone units have ARI (Air Conditioning & Refrigeration Institute)/ISO, NRTL (Nationally Recognized Testing Lab), or CSA (Canadian Standards Association) labels and are factory tested under normal operating conditions at nominal water flow rates. Quality assurance is provided via testing report cards shipped with each unit to indicate specific unit performance under cooling and heating modes of operation. Water source heat pumps are New York City MEA (Materials Equipment and Acceptance) 60-00-E rated.

Quiet operation

Fan motor insulation and compressor springs are provided for sound isolation, cabinets are fully insulated to reduce noise transmission, low speed blowers are utilized for quiet operation through reduced outlet air velocities, and air-to-refrigerant coils are designed for lower airflow coil face velocities.

Design flexibility

Airflow configurations for horizontal units are available in four patterns including left or right return, and left, right, or back discharge. Horizontal units are field convertible from left or right discharge to back discharge.

Vertical units are available in three airflow patterns including top discharge with right or left return. Extended water temperature range between 20 F and 110 F offers maximum design flexibility for all applications. Water flow rates as low as 1.5 gpm per ton assist with selection from a various range of circulating pumps. Factory-installed options are offered to meet specific design requirements.

Safe, reliable operation

Standard safety features for the refrigerant circuit include high-pressure switch, low-pressure sensor to detect loss of refrigerant and low air temperature sensor to safeguard against freezing. Equipment safety features include water loop temperature monitoring, voltage protection, water coil freeze protection, and standard electronic condensate overflow shutdown. All safety features are tested and run at the factory to assure proper operation of all components and safety switches.

All components are carefully designed and selected for endurance, durability, and carefree day-to-day operation.

The unit is shipped to provide internal and external equipment protection. Shipping supports are placed under the blower housing and compressor feet. In addition, horizontal and vertical units are both mounted on oversized pallets with lag bolts for sturdiness and maximum protection during transit.

Ease of installation

The unit is packaged for simple low cost handling, with minimal time required for installation. All units are prewired and factory charged with refrigerant. Horizontal units are provided with factory-installed hangar isolation brackets. Vertical units are provided with an internally trapped condensate drain to reduce labor associated with installing an external trap for each unit. Water connections (FPT) and condensate drains (FPT) are anchored securely to the unit cabinet.

Simple maintenance and serviceability

When regular maintenance or a service call is scheduled, the WSHP (Water Source Heat Pump) units require little time and are extremely easy to work on. Access is provided from three sides of the compressor section for better flexibility in confined spaces. The blower housing assembly can be serviced without disconnecting ductwork from the dedicated blower access panel. Blower units are provided with permanently lubricated bearings for worryfree performance. Also, blower inlet rings allow removal of the blower wheel without having to remove the housing or ductwork connections. Electrical disconnection of the blower motor and control box is easily accomplished from quick disconnects directly on each item. Effortless removal of the control box from the unit was designed to aid in providing access to all refrigeration components. The refrigeration circuit is easily tested and serviced through the use of high and low pressure ports integral to the refrigeration circuit. And if that was not enough, an insulated divider is standard to separate the blower section from the compressor section to allow service testing without air bypass.

Control features

Carrier's standard unit solid-state control system, the Complete Plus C, provides control of the unit compressor, reversing valve, fan, safety features, and troubleshooting fault indication features. The Complete Plus C is one of the most user friendly, low cost, and advanced control boards found in the WSHP industry. Many features are field selectable to provide the ultimate in field installation flexibility. The overall features of this standard control system include:

Anti-short cycle timer — Provides a minimum off time to prevent the unit from short cycling. The 5-minute timer energizes when the compressor is deenergized, resulting in a 5-minute delay before the unit can be restarted.

Random start relay — Ensures a random delay in energizing each different WSHP unit. This option minimizes peak electrical demand during start-up from different operating modes or after building power outages.

High and low pressure refrigerant protection — Safeguards against unreliable unit operation and refrigerant leak prevention.

Condensate overflow sensor —

Electronic sensor mounted to the drain pan. When condensate pan liquid reaches an unacceptable level, unit is automatically deactivated and placed in a lockout condition. Continuous overflow protection senses overflow levels for 30 continuous seconds to be recognized as a fault.

High and low voltage protection

— Safety protection in the case of excessive or low voltage conditions.

Automatic intelligent reset — Unit shall automatically restart 5 minutes after shutdown if the fault has cleared. Should a fault occur 3 times sequentially, then lockout will occur.

Accessory output — 24 V output is provided to cycle a motorized water valve, damper actuator, etc. with compressor for applications such variable speed and primary secondary pumping arrangements.

Performance Monitor (PM) —

Unique feature that monitors water temperatures to warn when the heat pump is operating inefficiently or beyond typical operating range. Field selectable parameter that initiates a warning code on the unit display.

Water coil freeze protection (selectable for water or antifreeze) —

Field selectable parameter for water and water/glycol solution systems and initiates a fault after 30 continuous seconds when temperatures exceed the selected limit.

Air coil freeze protection (check filter operation) — Field selectable parameter for assessing excessive filter pressure drop (i.e., from dirty filter, excessive external static, etc.) and initiates a fault after 30 continuous seconds when temperatures exceed the selected limit.

Alarm relay setting — Selectable 24 V or pilot duty dry contact for providing activation of a remote alarm.

Electric heat option — Output provided on the controller for operating two stages of emergency electric heat.

Service test mode with diagnostic LED (Light-emitting diode) —

The Test mode allows service personnel to check the operation of the WSHP and control system efficiently. Upon entering Test mode, time delays are sped up, and the Status LED will flash a code to indicate the last fault experienced for easy diagnosis. Based on the fault code flashed by the status LED, system diagnostics are aided with the use of Carrier provided trouble-shooting tables for easy reference to typical problems.

LED visual output — An LED panel indicates high pressure, low pressure, low voltage, high voltage, air/water freeze protection, condensate overflow, and control status.

**Size 036 high static not available as 265-1-60.

Options and accessories

Factory-installed options

Cupronickel heat exchangers are available for higher corrosion protection for applications such as open tower, geothermal, etc. Consult the water quality guidelines for proper application and selection of this option.

Sound attenuation package (mute package) is available for applications that require especially low noise levels. With this option, a double application of sound attenuating material is applied, access panels are double dampened with $^{1}/_{2}$ -in. thick density fiberglass insulation, and a unique application of special dampening material is applied to the curved portion of the blower. The mute package in combination with standard unit noise reduction features (i.e., as mentioned previously) provides sound levels and noise reduction to the highest degree.

Insulated water circuit is provided for the coaxial coil to prevent condensation, and therefore potential dripping problems, in applications where the entering water temperature is beyond the normal operating range (less than 60 F).

High static blower is available in sizes 048 for the 50RHR,RVR model and 030 and 036 for the RHS,RVS model for all airflow configurations. This option specifically provides increased airflow at various static pressure conditions, to provide even more flexibility to Carrier's high blower performance in the standard offering for each model number.

High temperature water switch interrupts the unit operation when the leaving water temperature is above normal conditions. This option assists with the protection of PVC and CPVC piping loops.

Enhanced Deluxe D control system provides the same functions as the Complete C control system while incorporating additional flexibility and functions to include:

- Thermostat input capabilities to accommodate emergency shutdown mode and night setback with override (NSB) potential
- Night setback from low temperature thermostat with 2-hour override is initiated by a momentary signal from the thermostat
- Compressor Relay Staging used with dual stage units (units with 2 compressors and 2 D controls) or in master/slave applications
- Boilerless electric heat control system that can switch automatically to electric heat at low loop water temperature
- Intelligent reversing valve operation that minimizes reversing valve operation for extended life and quiet operation
- Thermostat type select (Y, O or Y, W) that provides ability to work and select heat pump or heat/cool thermostats (Y, W)
- Reversing valve signal select (O or B) that provides selection for heat pump O/B thermostats
- Dehumidistat input that provides operation of fan control for dehumidification operation

- Multiple units on one thermostat/wall sensor provides for communication for up to three heat pumps on one thermostat
- Boilerless changeover temperature provides selection of boilerless changeover temperature set point
- Accessory relays are provided and configurable for multiple applications including fan and compressor cycling, digital night setback (NSB), mechanical night setback, water valve operation, and outside air damper operation

Field-installed accessories

Carrier's line of thermostats provides both programmable and non-programmable capability.

Programmable 7-day thermostat offers 2-stage heat, 2-stage cool, auto changeover, 7-day programmable with copy command, 4 settings per day, fully electronic, 24 vac, backlit LCD, keypad lockout, no batteries required, 5-minute compressor protection, NEVERLOST™ memory, 3 security levels, temperature display in degrees F or C.

Programmable 7-day light-activated thermostat offers same features as the 7-day programmable thermostat and includes occupied comfort settings with lights on, unoccupied energy savings with lights off.

Programmable 7-day flush-mount thermostat offers same features as the 7-day programmable thermostat and includes locking coverplate with tamper proof screws, flush to wall mount, holiday/vacation programming, set point limiting, dual point with adjustable deadband, O or B terminal, and optional remote sensor.

Programmable 5-day thermostat offers 2-stage heat, 2-stage cool, auto changeover, 5-minute built-in compressor protection, locking cover included, temperature display in degrees F or C, keypad lockout, backlit display, 5-1-1 programming, O or B terminal, dual set point with adjustable deadband, configurable display, self-prompting program, 4 settings per day.

Non-programmable thermostat with 2 heat stages, 2 cool stages, auto changeover, 5-minute built in compressor protection, locking cover included, temperature display in degrees F or C, keypad lockout, large display, back-lit display, O or B terminal, dual set point with adjustable deadband, backplate with terminals.

Loop controller with six stages (2 stages for heating and 4 stages for heat rejection) which includes:

- Loop temperature alarms
- Two pump single loop flow monitoring with the ability to manually select the lead pump
- One common alarm signal and indicating light and one audible alarm
- Loop water temperature sensor test circuit
- Functional test simulation from operator keypad
- Real timeclock, industrial noise ratings
- Loop water temperature control switch.

Filter rack (2 in.) is available in place of the standard 1-in. return air filter to enhance the filtration system of the water source heat pump. The 2-in. filter rack does not include filters.

Carrier Comfort Network (CCN) controller is compatible with all water source heat pumps and is provided as a field-installed accessory.

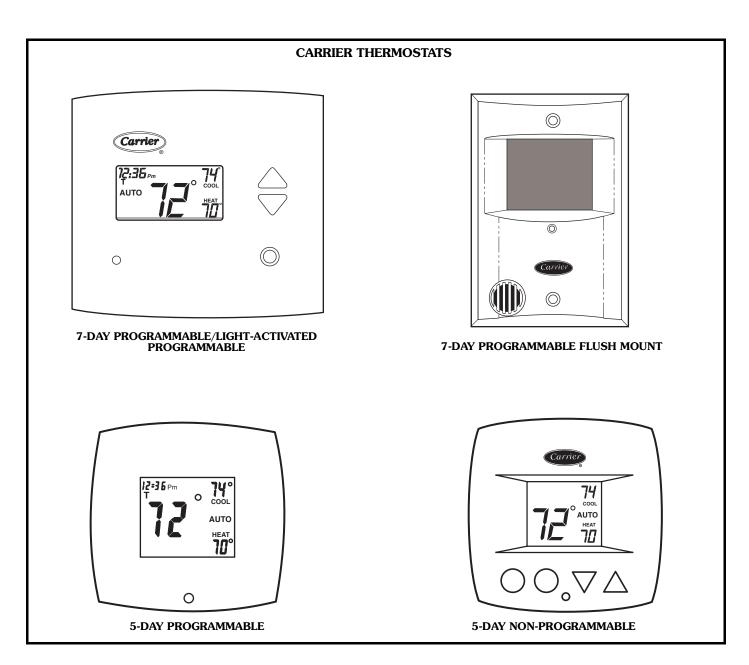

Fire-rated hoses are 2 ft long and have a fixed MPT on one end and a swivel with an adapter on the other end. Hose kits can be either stainless steel or galvanized. Five sizes are available (1/2, 3/4, 1, 11/4, 11/2 in.).

Ball valves (brass body) used for shut off and balancing water flow. Available with memory, memory stop, and pressure temperature ports. UL-listed brass body, ball and stem type with Teflon seats and seals. Five sizes are available $\binom{1}{2}$, $\binom{3}{4}$, $\binom{1}{4}$, $\binom{1}{4}$, $\binom{1}{2}$ in.).

Y strainers (bronze body) are "Y" type strainers with a brass cap. Maximum operating pressure rating of 450 psi. Strainer screen made of stainless steel. Available with blow down valves. Four sizes are available $(^3/_4, 1, 1^1/_4, 1^1/_2 \text{ in.})$.

Solenoid valves (brass body) offer 3.5 watt coil, 24 volt, 50/60 Hz, 740 amps inrush, .312 amps holding. Slow operation for quiet system application. Four sizes are available $(^{3}/_{4}, 1, 1^{1}/_{4}, 1^{1}/_{2} \text{ in.})$.

Hose kit assembly supply hose includes a ported ball valve with pressure temperature (P/T) plug ports, flexible stainless steel hose with swivel and nipple. Return hose includes a ball valve, preset measure flow (gpm) with two P/T ports, flexible stainless steel hose with a swivel and nipple, balancing valve, and low-pressure drop water control valve.

LEGEND

Coefficient Performance COP -Energy Efficiency Ratio Entering Water Temperature **Total Capacity**

NOTES:

- A water-to-air heat pump using water pumped from a well, lake or stream functioning as a heat source/heat sink.
- The temperature of the water is related to the climatic conditions and may vary from 40 F to 80 F.
- Certified in accordance with the ARI/ISO Standard 13256-1 Certification Program, which replaces ARI Standard-325. Size 006 available as RHR only.

ARI/ISO capacity notes

- 1. Cooling capacities based upon 80.6 F DB (dry bulb), 66.2 F WB (wet bulb) entering-air temperature.
- 2. Heating capacities based upon 68 F DB, 59 F WB entering-air temperature.
- 3. All ratings based upon 208 volt operation.

COP Coefficient Performance Energy Efficiency Ratio Entering Water Temperature Total Capacity

- A water-to-air heat pump using water or brine circulating in a common piping loop functioning as a heat source/heat sink.

 The temperature of the water or brine loop is usually mechanically controlled within a temperature range of 60 F to 90 F.

 Certified in accordance with the ARI/ISO Standard 13256-1 Certification Program, which replaces ARI Standard-320.

COP Coefficient Performance Energy Efficiency Ratio Entering Water Temperature EER

Total Capacity

- NOTES:

 1. A brine-to-air heat pump using a brine solution circulating through a subsurface piping loop functioning as a heat source/heat sink.

 2. The heat exchange loop may be placed in horizontal trenches or vertical
- The heat exchange loop may be placed in horizontal trenches or vertical bores, or be submerged in a body of surface water.

 The temperature of the brine is related to the climatic conditions and may
- vary from 20 F to 110 F. Certified in accordance with the ARI/ISO Standard 13256-1 Certification Program, which replaces ARI Standard-330.

ARI/ISO capacity notes

- 1. Cooling capacities based upon 80.6 F DB (dry bulb), 66.2 F WB (wet bulb) entering-air temperature.
- 2. Heating capacities based upon 68 F DB, 59 F WB entering-air temperature.
- 3. All ratings based upon 208 volt operation.
- 4. All ARI performance is based upon airflow rated at high speed.

Selection procedure (with 50RHR024 example)

I Determine the actual cooling and heating loads at the desired dry bulb and wet bulb conditions.

Assume cooling load at desired dry bulb 80 F and wet bulb 65 F conditions are as follows:

Given:

Total Cooling (TC)	.22,100	Btuh
Sensible Cooling (SC)	.16,500	Btuh
Entering-Air Temperature db		80 F
Entering-Air Temperature wb		65 F

II Determine the following design parameters.

Entering water temperature, water flow rate (GPM), airflow (CFM), water flow pressure drop and design wet and dry bulb temperatures. Airflow CFM should be between 300 and 450 CFM per ton. Unit water pressure drop should be kept as close as possible to each other to make water balancing easier. Enter the appropriate tables and find the proper indicated water flow and water temperature.

For example:

Entering Water Temp	90 F
Water Flow (Based upon	
12 F rise in temp) 4	5 GPM
Airflow Cfm	'00 Cfm

III Select a unit based on total cooling and total sensible cooling conditions. Unit selected should be closest to but not larger than the actual cooling load.

Enter tables at the design water flow and water temperature. Read the total and sensible cooling capacities.

NOTE: Interpolation is permissible, extrapolation is not.

For example:

Enter the 50RHR024 Performance Table at design water flow and water temperature. Read Total Cooling, Sensible Cooling and Heat of Rejection capacities:

Total Cooling	21,900 Btuh
Sensible Cooling	. 16,700 Btuh
Heat of Rejection	29,000 Btuh

Read the Heat Capacity. If the Heat Capacity exceeds the design criteria, it is acceptable.

NOTE: It is quite normal for water source heat pumps to be selected on cooling capacity only since the heating output is usually greater than the cooling capacity.

IV Determine the correction factors associated with the variable factors of dry bulb and wet bulb using the Corrections Factor tables found in this book.

Using the following formulas to determine the correction factors of dry bulb and wet bulb:

- a) Corrected Total Cooling = tabulated total cooling x wet bulb correction x airflow correction.
- b) Corrected Sensible Cooling = tabulated sensible cooling x wet/dry bulb correction x airflow correction

V Determine entering air and airflow correction using the Corrections Factor tables found in this book.

Using the following formulas to determine the correction factors of entering air and airflow correction:

		Table	Ent Air	Airflow		Corrected
Corrected Total Cooling	=	21,900 x	0.971	x 0.985	=	20,946
Corrected Sensible Cooling	=	16,700 x	1.070	x 0.938	=	16,761
Corrected Heat of Rejection	=	29,000 x	0.969	x 0.983	=	26,358

Compare the corrected capacities to the load requirements established in Step I. If the capacities are within 10% of the load requirements, the equipment is acceptable. It is better to undersize than oversize as undersizing improves humidity control, reduces sound levels and extends the life of the equipment.

VI Water temperature rise calculation and assessment.

Calculate the water temperature rise and assess the selection using the following calculation:

Actual Temperature Rise =
$$\frac{\text{Correction of Heat Rejection}}{\text{GPM x } 500}$$

For example, using the Corrected Heat of Rejection from the last step:

Actual Temperature Rise =
$$\frac{26,358}{4.5 \times 500}$$
 = 11.7 F

If the units selected are not within 10% of the load calculations, review what effect changing the GPM, water temperature and/or airflow will have on the corrected capacities. If the desired capacity cannot be achieved, select the next larger or smaller unit and repeat Steps I through VI.

Selection procedure (with 50RHR024 example) (cont) Carrier

VII ARI/ISO/ASHRAE 13256-1 Conversion

Performance standard ARI/ISO/ASHRAE 13256-1 became effective on January 1, 2000 and replaced the existing ARI Standards 320 Water-Loop Heat Pumps (WLHP), 325 Ground-Water Heat Pumps (GWHP), and 330 Ground-Loop Heat Pumps (GLHP).

The ARI/ISO Standard incorporates a consistent rating methodology for including fan and pump energy for calculating cooling capacity, heating capacity, and energy efficiency ratios (EER). This simplifies the use of rating data for heat pump performance modeling in seasonal energy analysis calculations, and allows for direct rating comparisons across applications.

a) ISO Capacity and Efficiency Equations

The following equations are used to calculate and correct cooling capacity, heating capacity, and respective EER:

ISO Cooling Capacity = (Cooling Capacity in Btuh) + (Fan Power Correction in Watts x 3.412)

ISO Cooling EER = (ISO Cooling Capacity in Btuh/3.412)/(Power Input in watts – fan power correction in watts + pump power correction in watts) = Watts/Watts

NOTE: Do not divide ISO Cooling Capacity by 3.412 to obtain Btuh/Watts.

ISO Heating Capacity = (Heating Capacity in Btuh) – (Fan Power Correction in Watts x 3.412)

ISO Heating EER = (ISO Heating Capacity in Btuh/3.412)/(Power Input in watts – fan power correction in watts + pump power correction in watts) = Watts/Watts

NOTE: Do not divide ISO Heating Capacity by 3.412 to obtain Btuh/Watts.

Refer to English to SI conversion table in this

b) Identify the design conditions corrected for air and water conditions.

Airflow Cfm = 700 Cfm

Water Flow

(Based upon 12F rise in temp) = 4.5 GPM

External Static Pressure = 0.4 in. wg

Water Pressure Drop = 7.9 ft of head

Power input = 2.060 watts

Cooling Capacity = 20,946 Btuh

c) Perform Fan Power Correction Adjustment Use the following formula to calculate Fan Power Correction:

Fan Power

Correction = $(Cfm \times 0.472) \times (External Static)$

Pressure x 249)/300 = Watts

 $= (700 \times 0.472) \times (0.4 \times 249)/300$

= 110 Watts

d) Perform Pump Power Correction Adjustment

Use the following formula to calculate Pump Power Correction:

Pump Power

Correction

= (GPM x 0.0631) x (Pressure Drop

x 2,990)/300

= Watts

 $= (4.5 \times 0.0631) \times$ $(7.9 \times 2.990)/300$

= 22 Watts

e) Perform capacity and EER calculations

Use the following formula to calculate capacity and EER:

ISO Cooling

Capacity

= (Cooling Capacity) + (Fan Power

Correction x 3.412)

 $= 20,946 + (110 \times 3.412)$

= 21.321 Btuh

f) Perform Corrections by using the ISO Equations

ISO EER = (ISO Cooling Capacity/3.412)/ (Power Input - Fan Power Correction + Pump Power Correction)

= Watts/Watts

NOTE: Do not divide ISO Cooling Capacity by 3.412 to obtain Btuh/Watts.

= (21,321/3.412)/(2,060-110+22)

= 3.27 Watts/Watt

= 10.81 Btuh/Watt

LEGEND

EWT — Entering Water Temperature (F)

GPM — Gallons Per Minute

TC — Total Capacity (Btuh)

THA — Total Heat of Absorption (Btuh)

THR — Total Heat of Rejection (Btuh)

TSC — Total Sensible Capacity (Btuh)

NOTES:

Interpolation is permissible, extrapolation is not.
 All entering air conditions are 80 F db (dry bulb) and 67 F wb (wet bulb) in cooling and 70 F db in heating.
 ARI 320 points (bold printing) are shown for comparison purposes only. These are not certified data points.
 All performance data is based upon the lower voltage of dual voltage or tod units.

age rated units.

- Operation below 60 F EWT requires optional insulated water circuit. Operation below 40 F EWT is based upon 15% antifreeze solution.
- See Correction Factor tables for operating conditions other than those listed above.
- 8. Performance capacities shown in thousands of Btuh.

LEGEND

EWT — Entering Water Temperature (F)

GPM — Gallons Per Minute

TC — Total Capacity (Btuh)

THA — Total Heat of Absorption (Btuh)

THR — Total Heat of Rejection (Btuh)

TSC — Total Sensible Capacity (Btuh)

NOTES:

Interpolation is permissible, extrapolation is not.
 All entering air conditions are 80 F db (dry bulb) and 67 F wb (wet bulb) in cooling and 70 F db in heating.
 ARI 320 points (bold printing) are shown for comparison purposes only. These are not certified data points.
 All performance data is based upon the lower voltage of dual voltage or tod units.

age rated units.

- Operation below 60 F EWT requires optional insulated water circuit. Operation below 40 F EWT is based upon 15% antifreeze solution.
- See Correction Factor tables for operating conditions other than those listed above.
- 8. Performance capacities shown in thousands of Btuh.

LEGEND

EWT — Entering Water Temperature (F)

GPM — Gallons Per Minute

TC — Total Capacity (Btuh)

THA — Total Heat of Absorption (Btuh)

THR — Total Heat of Rejection (Btuh)

TSC — Total Sensible Capacity (Btuh)

NOTES:

Interpolation is permissible, extrapolation is not.
 All entering air conditions are 80 F db (dry bulb) and 67 F wb (wet bulb) in cooling and 70 F db in heating.
 ARI 320 points (bold printing) are shown for comparison purposes only. These are not certified data points.
 All performance data is based upon the lower voltage of dual voltage or tod units.

age rated units.

- Operation below 60 F EWT requires optional insulated water circuit. Operation below 40 F EWT is based upon 15% antifreeze solution.
- See Correction Factor tables for operating conditions other than
- those listed above. 8. Performance capacities shown in thousands of Btuh.

EWT — Entering Water Temperature (F)
GPM — Gallons Per Minute
TC — Total Capacity (Btuh)
THA — Total Heat of Absorption (Btuh)
THR — Total Heat of Rejection (Btuh)
TSC — Total Sensible Capacity (Btuh)

- Interpolation is permissible, extrapolation is not.
 All entering air conditions are 80 F db (dry bulb) and 67 F wb (wet bulb) in cooling and 70 F db in heating.
 ARI 320 points (bold printing) are shown for comparison purposes only. These are not certified data points.
- 4. All performance data is based upon the lower voltage of dual volt-
- Operation below 40 F EWT is based upon 15% antifreeze solution.
- See Correction Factor tables for operating conditions other than
- 7. Performance capacities shown in thousands of Btuh.

EWT — Entering Water Temperature (F)
GPM — Gallons Per Minute
TC — Total Capacity (Btuh)
THA — Total Heat of Absorption (Btuh)
THR — Total Heat of Rejection (Btuh)
TSC — Total Sensible Capacity (Btuh)

- Interpolation is permissible, extrapolation is not.
 All entering air conditions are 80 F db (dry bulb) and 67 F wb (wet bulb) in cooling and 70 F db in heating.
 ARI 320 points (bold printing) are shown for comparison purposes only. These are not certified data points.
- 4. All performance data is based upon the lower voltage of dual volt-
- Operation below 40 F EWT is based upon 15% antifreeze solution.
- See Correction Factor tables for operating conditions other than
- 7. Performance capacities shown in thousands of Btuh.

LEGEND

Shaded areas are below minimum CFM. This data is provided for troubleshooting information only.
 Cubic Feet Per Minute

CFM

*Size 006 available in 50RHR units only.

NOTES:

- Units factory shipped on medium speed. Other speeds require field selection.
- All airflow is rated on 208 v operating with wet coil and clean air filter.
- All units ARI/ISO/ASHRAE 13256-1 rated on high fan speed.
 575-v units, equipped with two-speed (H and M) fan.

LEGEND

— Not Recommended

- NOTES:

 1. Includes allowance for wet coil and clean factory-installed filter.

 2. Factory settings are indicated in **bold** print.

 3. Units factory shipped on medium speed (size 015 on Low). Other speeds require field selection.

 4. All airflow is rated on 208 v operating with wet coil and clean air filter.

 5. All units ARI/ISO/ASHRAE 13256-1 rated on high (size 015 rated on medium).

FLA — Full Load Amps
HACR — Heating, Air Conditioning and Refrigeration
LRA — Locked Rotor Amps
RLA — Rated Load Amps

Typical piping and wiring

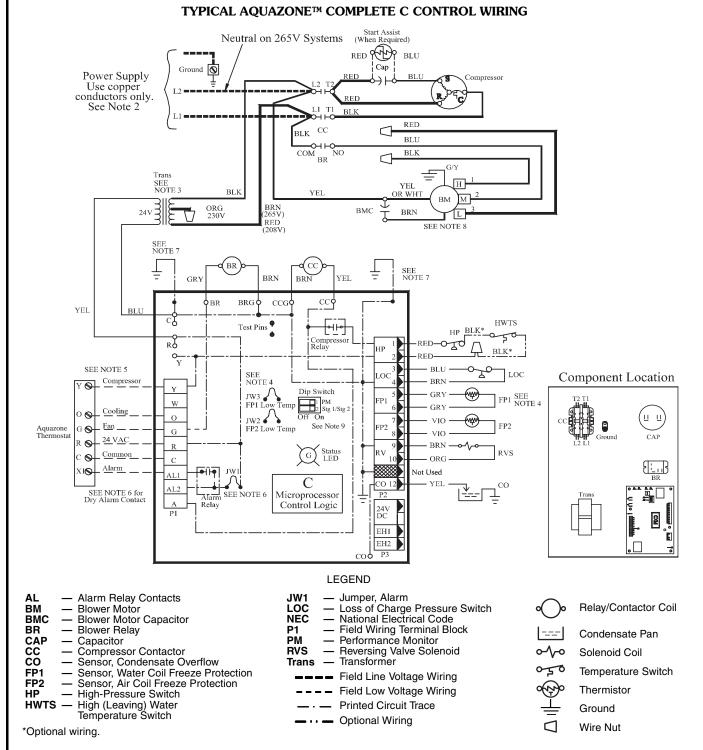

Typical wiring schematics

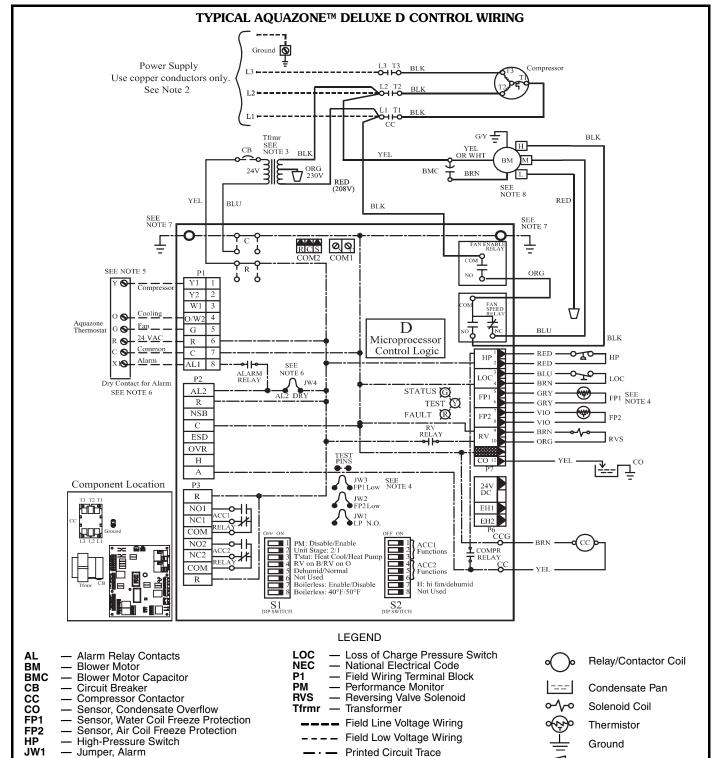

- 1. Compressor and blower motor thermally protected internally.
- All wiring to the unit must comply with NEC and local codes. Transformer is wired to 265 v (BRN) lead for 265/1/60 units, or 208 v (RED) lead for 208/1/60. For 230/1/60 switch RED and ORG leads at L1 and insulate RED lead. Transformer is energy limiting or may have circuit breaker.
- 4. FP1 thermistor provides freeze protection for water. When using antifreeze solutions, cut JW3 jumper.
- Typical Aquazone thermostat wiring shown. Refer to thermostat installation instructions for wiring to the unit. Thermostat wiring must be Class 1 and voltage rating equal to or greater than unit supply voltage.
- 6. 24-v alarm signal shown. For dry alarm contact, cut JW1 jumper and dry contact will be available between AL1 and AL2.
- Transformer secondary ground via control board standoffs and screws to control box. (Ground available from top two standoffs as shown.)
- For high or low speed remove BLU wire from BR 'NO' and replace with BLK or RED wire respectively. Tape off unused
- 9. Both DIP switches need to be in the ON position.

Typical wiring schematics (cont)

- · — Printed Circuit Trace

NOTES:

JW1

- Compressor and blower motor thermally protected internally.
 All wiring to the unit must comply with NEC and local codes.
 Transformer is wired to 208 v (RED) lead for 208/3/60. For 230/3/60 switch RED and ORG leads at L1 and insulate RED lead.
- 4. FP1 thermistor provides freeze protection for water. When using antifreeze solutions, cut JW3 jumper.
- Typical Aquazone thermostat wiring shown. Refer to thermostat installation instructions for wiring to the unit. Thermostat wiring must be Class 1 and voltage rating equal to or greater than unit supply voltage.
- 6. 24-v alarm signal shown. For dry alarm contact, cut AL2 dry jumper and dry contact will be available between AL1 and AL2.

 \Box

Wire Nut

- Transformer secondary ground via control board standoffs and screws to control box. (Ground available from top two standoffs as shown.)
- 8. Blower motor is factory wired for medium and high speeds. For any other combination of speeds, attach the lower speed wire to fan speed relay N.O. wire.

Application data

Aquazone™ water source heat pumps may be used in water loop, ground water, and ground loop type systems. The units are capable of operating with entering water temperatures between 20 F and 110 F. Factory-installed options are available to provide the flexibility for adaptation to various water source heat pump applications.

Water loop system

Water loop system applications typically include a number of units plumbed to a common piping system. For optimal performance, this sytem should be designed between 2.25 and 3 gpm per ton of cooling capacity. The system is comprised of highly efficient packaged reverse cycle heat pump units interconnected by way of a water loop. The water circuit serves as both a sink and source for heat absorption and rejection and is typically designed for entering water temperatures between 60 F and 90 F. Within this temperature range units can heat or cool as required from the same water source. Transferring heat from warm to cold spaces in the building, whenever they coexist, conserves energy rather than creating new heat.

Ground water systems

To utilize Aquazone units in ground water applications, extended range should be specified. This will provide factory-installed insulation on the coaxial coil to prevent condensate from dripping due to entering water temperatures that are below 60 F. In addition, the copper coaxial coil that is installed on the Aquazone units may not be suitable due to water conditions. Refer to the Water Conditioning section for proper coaxial coil material selection.

Surface water system — This system is typically located near a lake or pond. In this application, the loop can be submerged in a series of coils beneath the water surface. The number of coils required depends on system load and design. This application requires minimum piping and excavation.

Open loop system — This system is used where ground water is plentiful. In this application, ground water is pumped through supply piping from the well to the building. Ground water is pumped through supply piping from the well to the building in ground water applications. The water is then pumped back into the ground through a discharge well as it leaves the building. An additional heat exchanger is usually installed between the building water piping system and the ground water piping system. This design limits the amount of piping and excavation required.

Aquazone units are provided with a standard TXV and are rated to extremely low temperatures to self-adjust the refrigeration circuit, therefore water regulating valves are not required on open loop systems. To conserve water on this type of system, a slow opening/closing solenoid valve is recommended.

Ground loop systems

There are many commonly specified designs for ground loop applications. Typical designs include vertical loops and horizontal loops. In some applications, water is piped from the ground or lake directly to the water source heat pump. Piping is limited to the amount of pipe required to get the water from the source to the unit.

NOTE: When utilizing Aquazone water source heat pumps in ground loop systems, refer to design considerations in the ground water system section.

Horizontal ground loop — This system is used when adequate space is available and trenching can be easily accomplished. A series of parallel pipes are laid out in trenches 3 to 6 feet below the ground surface then back-filled. Often multiple pipes are used to maximize the heat transfer capability of each trench. The amount of pipe and the size of the ground loop field are based on ground conditions, heating, and cooling requirements of the application and system design.

Vertical ground loop — This system is used in vertical borehole applications. This design is well suited for retrofit applications due to space limitations or where landscaping is already complete and minimum disruption of the site is desired. The vertical ground loop system contains a single loop of pipe inserted into a hole. The hole is back-filled and grouted after the pipe is inserted. The completed loop is concealed below ground. The number of loops required depends on ground conditions, heating and cooling requirements, and the depth of each hole.

Hybrid systems — In some applications, it may be beneficial to incorporate a cooling tower into the ground loop system to reduce the overall cost. A Hybrid System discards excess heat into the air and increases the cooling performance of the ground loop.

Condensate drainage

Condensate lines should be properly vented to prevent fan pressure from causing water to hang up in the piping. Condensate lines should be pitched to assure full drainage of condensate under all load conditions. Chemical treatment should be provided to remove algae in the condensate pans and drains in geographical areas that are conducive to algae growth.

Horizontal units — Horizontal units should be sloped toward the drain at a $^{1}/_{4}$ in. per foot pitch. If it is not possible to meet the pitch requirement, a condensate pump should be designed and installed at the unit to pump condensate to a building drain. Horizontal units are not internally trapped; therefore an external trap is necessary. Each unit must be installed with its own individual trap and means to flush or blowout the condensate drain. The design of a common trap or vent for multiple units is not acceptable. The condensate piping system should not be designed with a pipe size smaller than the drain connection pipe size.

Vertical units — Vertical units utilize a condensate hose inside the cabinet that acts as a trapping loop, therefore an external trap is not necessary. Each unit must be installed with its own individual vent and means to flush or blowout the condensate drain lines. Do not install units with a common trap or vent.

Application data (cont)

Water conditioning

In some applications, maintaining proper water quality may require the use of higher corrosion protection for water-to-refrigerant heat exchanger. Water quality varies from location to location and is unique for each job. Water characteristics such as pH value, alkalinity, hardness, and specific conductance are of importance when considering any WSHP application. Water typically includes impurities and hardness that must be removed. The required treatment will depend on the water quality as well as type of system. Refer to the Part V of Carrier System Design Manual for additional information. Water problems fall into three main categories:

 Scale formation caused by hard water reduces the heat transfer rate and increases the water pressure drop through the heat exchanger. As water is heated,

- minerals and salts are precipitated from a solution, and deposited on the inside surface of the pipe or tube.
- 2. Corrosion is caused by absorption of gases from the air coupled with water on exposed metal. Corrosion is also common in salt-water areas.
- Organic growths such as can reduce the heat transfer rate by forming an insulating coating on the inside tube surface. Algae can also promote corrosion by pitting.

NOTE: In most commercial applications, Aquazone™ WSHP units use copper water-to-refrigerant heat exchanger. Units can also be equipped with a Cupro-nickel heat exchanger for applications where water is outside the standard contaminant limits for a copper heat exchanger.

WATER QUALITY GUIDELINES

CONDITION	ACCEPTABLE LEVEL								
pН	7 to 9 range for copper. Cupro-nickel may be used in the 5 to 9 range.								
Total Hardness	Calcium and magnesium carbonate should not excee	d 20 grains per gallon (350 p	pm).						
Iron Oxides	Less than 1 ppm.								
Iron Bacteria	No level allowable.								
Corrosion*	Ammonia, Ammonium Hydroxide Ammonium Chloride, Ammonium Nitrate Ammonium Sulfate Chlorine/Chlorides Hydrogen Sulfide†	Max Allowable Level 0.5 ppm 0.5 ppm 0.5 ppm 0.5 ppm None Allowable	Coaxial Metal Cu Cu Cu Cu CuNi						
Brackish	Use Cupro-nickel heat exchanger when concentration than 125 ppm are present. (Seawater is approximatel		ide are greater						

^{*}If the concentration of these corrosives exceeds the maximum allowable level, then the potential for serious corrosion problems exists.

NOTE: To convert ppm to grains per gallon, divide by 17. Hardness in mg/l is equivalent to ppm.

[†]Sulfides in the water quickly oxidize when exposed to air, requiring that no agitation occur as the sample is taken. Unless tested immediately at the site, the sample will require stabilization with a few drops of one Molar zinc acetate solution, allowing accurate sulfide determination up to 24 hours after sampling. A low pH and high alkalinity cause system problems, even when both values are within ranges shown. The term pH refers to the acidity, basicity, or neutrality of the water supply. Below 7.0, the water is considered to be acidic. Above 7.0, water is considered to be basic. Neutral water contains a pH of 7.0.

Solenoid valves

In applications using variable flow pumping, solenoid valves can be field installed and operated from the control board in the Aquazone TM WSHP unit.

Freeze protection

Applications where systems are exposed to outdoor temperatures below freezing (32 F) must be protected from freezing. The most common method of protecting water systems from freezing is adding glycol concentrations into the water. Design care should used when selecting both the type and concentrations of glycol utilized due to the following:

• Equipment and performance may suffer with high concentrations of glycol and other antifreeze solutions

- Loss of piping pressure may increase greatly, resulting in higher pumping costs
- Higher viscosity of the mixture may cause excess corrosion and wear on the entire system
- Acidity of the water may be greatly increased, promoting corrosion
- Glycol promotes galvanic corrosion in systems of dissimilar metals. The result is corrosion of one metal by the other, causing leaks.

			ESTIMATED IMPACT TO AQUAZONE UNIT

LEGEND

DB — Dry Bulb EAT — Entering Air Temperature

- Based on nominal 400 cfm per ton airflow, 70 F EAT heating and 80/67 F EAT cooling.
- Cooling air and water numbers can vary greatly with changes in humidity.
- 3. Subcooling is based upon the head pressure at compressor service port.

WATER TEMPERATURE CHANGE THROUGH HEAT EXCHANGER

WATER FLOW RATE (GPM)		LING E (F)	HEATING DROP (F)	
` ,	Min	Max	Min	Max
For Closed Loop: Ground Source or Cooling/Boiler Systems at 3 gpm/ton	9	12	4	8
For Open Loop: Ground Water Systems at 1.5 gpm/ton	20	26	10	17

Acoustical design

Sound power levels represent the sound as it is produced by the source (e.g., WSHP unit) with no regard to attenuation between the source and the space. Acoustical design goals are necessary to provide criteria for occupied spaces where people can be comfortable and communicate effectively over the background noise of the air-conditioning system and other background noise sources.

Acoustical design goals are desirable sound pressure levels within a given conditioned space and are represented by Noise Criteria (NC) curves. Noise Criteria (NC) curve levels represent a peak over a full spectrum of frequencies. A high value in a low frequency band has the same effect on NC level as a lower value in a high frequency band. It is important that sound levels be balanced over the entire spectrum relative to the NC curve. The lower the NC criteria curve, the more stringent the room acoustical design must be to meet the design goals.

It is important to know how to convert NC levels from the unit ratings in terms of sound power (Lw). This conversion depends on the specifics of the acoustical environment of the installation.

The resulting calculations are compared to the NC curve selected for the area to assess the acoustical design.

Some of the factors that affect conversion of sound power to sound pressure and consequent NC level include:

- Type of acoustical ceiling
- Use of metal or flex duct
- Absorption in the occupied space
- Location in the occupied space
- Open or closed layout plan
- Use of open or ducted returns
- Orientation of unit to occupant
- Use of lined or unlined duct

OCTAVE BAND SOUND PRESSURE LEVEL (Lp) ASSOCIATED WITH NC CURVES

NOISE	OCTAVE BAND SOUND PRESURE LEVEL (Lp)										
CRITERIA	Frequency (Hz)										
CURVES	63	125	250	500	1000	2000	4000	8000			
NC-15	49	36	26	17	17	14	12	11			
NC-20	52	41	33	27	22	19	17	16

NC-60	77	71	67	63	61	59	58	57			
NC-65	80	75	71	68	66	64	63	62			

Application data (cont)

The analysis of the projected sound level in the conditioned space caused by a WSHP unit located in a ceiling plenum is quite involved. The key is to have good sound power ratings (Lw) in dB on the equipment to determine the sound attenuation effect of the ductwork, ceiling and room. In combination with utilizing standard Aquazone equipment attenuating features or the advanced mute package features, suggestions for horizontal and vertical unit sound design are provided to design around the WSHP units.

Horizontal units

Use the following guidelines for layout of Aquazone horizontal units to minimize noise:

- 1. Obtain sound power ratings in accordance with latest standards from manufacturers to select quietest equipment.
- Do not locate units over a space with a required NC of 40 or less. Instead, locate units above less sensitive noise areas. Locate them above or in equipment rooms, utility closets, restrooms, storage rooms, or above corridors.
- 3. Provide at least 10 feet between WSHP units to avoid the additive effect of two noise sources.
- 4. Provide an acoustical pad underneath the WSHP unit in applications where the unit must be mounted above noise sensitive areas such as private offices or conference rooms. The pad attenuates radiated noise. Be sure the pad has an area at least twice that of the WSHP footprint.
- 5. Maximize the installed height above the suspended ceiling.
- 6. Be sure the WSHP unit is located at least 6 feet away from any ceiling return grille to prevent line-of-site casing noise to reach the space below.
- 7. Suspend the WSHP unit from the ceiling with hangers that utilize spring or neoprene type isolators to reduce vibration transmission.
- 8. Utilize flexible electrical connections to the WSHP unit. DO NOT USE NOT RIGID CONNECTIONS.
- 9. Utilize flexible loop water and condensate piping connections to the WSHP unit.
- 10. Use a canvas duct connector to connect the WSHP discharge to the downstream duct system. This reduces vibration-induced noise.
- Provide acoustic interior lining for the first 20 feet of discharge duct, or until the first elbow is reached. The elbow prevents line-of-site sound transmission in the discharge duct.
- Provide turning vanes in ductwork elbows and tees to reduce air turbulence.

- 13. Size the sheet metal supply duct with velocities no greater than 1000 fpm.
- 14. Ensure ductwork is rigid.
- 15. Use round duct whenever possible to further reduce noise.
- 16. Allow at least 3 equivalent duct diameters of straight duct upstream and downstream of the unit before allowing any fittings, transitions, etc.
- 17. Seal all penetrations around duct entering the space.
- 18. Provide a 4-ft. run-out duct made of flexible material to connect a diffuser to the supply trunk duct. The flex duct provides an "attenuating end-effect" and reduces duct-transmitted sound before it reaches the space. Typically a 6 db sound reduction can be accomplished with the use of flex duct.
- 19. Locate the run-out duct balancing damper as far away from the outlet diffuser as possible. Locating the balancing damper at the trunk duct exit is the best location.
- 20. If return air is drawn through a ceiling plenum, provide an acoustically lined return duct elbow or "L" shaped boot at the WSHP to eliminate line-of-site noise into the ceiling cavity and possible through ceiling return air grilles. Face the elbow or boot away from the nearest adjacent WSHP unit to prevent additive noise.
- 21. Do not hang suspended ceiling from the ductwork.

Vertical units

All guidelines established for horizontal units also apply for vertical units. In addition, since vertical units tend to be installed in small equipment rooms or closets, the following additional guidelines apply:

- 1. Mount the unit on a pad made of high-density sound absorbing material such as rubber or cork. Extend the pad beyond the WSHP unit footprint by at least 6 inches in each direction.
- 2. Since the unit returns airflow through a grille mounted in a closet door, provide a sound barrier or some other modification of the closet to prevent line-of-site noise into the space.
- 3. Follow good duct design practice in sizing and locating the connection of the WSHP discharge to the supply duct system. Use an elbow with turning vanes and bent in the direction of the fan rotation to minimize turbulence. Make any duct transitions as smooth and as gradual as possible to again minimize turbulence and loss of fan static pressure.

Guide specifications

Packaged Water Source Heat Pumps HVAC Guide Specifications

Size Range:

50RHR,RVR: **6,200 to 59,000 Btuh**

Cooling Capacity 7,400 to 68,000 Btuh

Heating Capacity

50RHS,RVS: **14,100 to 63,700 Btuh**

Cooling Capacity

16,300 to 78,300 Btuh Heating Capacity

Carrier Model Number: 50RHR, 50RVR, 50RHS, 50RVS

Part 1 — General

1.01 SYSTEM DESCRIPTION

- A. Install Water Source Heat Pumps, as indicated on the plans with capacities and characteristics as listed in the schedule and the specifications that follow. Units shall be Carrier model 50RHR,50RHS (Horizontal) or model 50RVR,50RVS (Vertical) configurations.
- B. Units shall be supplied completely factory built and capable of operation with an entering water temperature range from 20 to 110 F as standard.
 - Equivalent units from other manufacturers can be proposed provided approval to bid is given 10 days prior to bid closing.
- C. Units shall be individually packaged with wooden skid covered with protective corner posts and plastic stretch wrapping for maximum protection.

1.02 QUALITY ASSURANCE

- A. All equipment listed in this section must be rated in accordance with ARI/ASHRAE/ISO 13256-1 performance standard and CSA. The units shall have ARI/ISO, NRTL, and CSA labels.
- B. All units shall be factory tested under normal operating conditions at nominal water flow rates. This testing shall generate a report card to be shipped with each unit stating performance in both Heating and Cooling modes.
- C. Serial numbers will be recorded by factory and furnished to contractor for ease of unit warranty status. Units which are tested without water flow rates are not acceptable.

Part 2 — Product

2.01 EQUIPMENT

A. General:

 The horizontal and vertical heat pumps shall be fabricated from heavy gage galvanized sheet metal. All interior surfaces shall be lined with 1/2 in. thick, 11/2 lb acoustic type fiberglass insulation. All fiberglass shall be coated and have exposed edges tucked under flanges to prevent the introduction of glass fibers into the airstream. All insulation must meet NFPA 90A.

2. Units shall be prewired and precharged in factory.

B. Unit Cabinet:

- Units must have the ability to be field convertible from side to back or back to side discharge with no additional parts or unit structure modification. Units will have factory-installed hanger brackets and isolation grommets.
- 2. Horizontal Units shall have one of the following airflow arrangements: Right-Discharge/Left-Return; Left-Discharge/Right-Discharge Return; Back-Discharge/Left-Return; or Back-Discharge/Right-Return as shown on the plans.
- 3. Vertical Units shall have one of the following air flow arrangements: Left-Return/Top-Discharge, or Right-Return/Top-Discharge. All vertical units will be supplied from the factory internally trapped.
- 4. If units with these arrangements are not used, the contractor is responsible for any extra costs incurred by other trades.
- 5. Cabinets shall have separate openings and knockouts for entrance of line voltage and low voltage control wiring. Contractor must ensure that units can be easily removed for servicing and coordinate locations of electrical conduit and lights with the electrical contractor.
- 6. All units must have a minimum of three access panels for serviceability of compressor compartment. If other arrangements make servicing difficult, the contractor must provide access panels and clear routes to ease service. Architect must approve any changes in layout.
- All units must have an insulated panel separating the fan compartment from the compressor compartment.
- 8. Optional Mute package shall consist of high technology sound attenuating materials that are strategically applied to the cabinet, in addition to the standard system, to further dampen sound.
- 9. Units with the compressor in the airstream are not acceptable.

C. Fan and Motor Assembly:

- 1. Units rated 60,000 Btuh and under shall have a direct-drive centrifugal fan. The fan motor shall be 3-speed, permanently lubricated, PSC type with internal thermal overload protection.
- Blower shall have inlet rings to allow removal of wheel and motor from one side without removing housing.
- Units supplied without permanently lubricated motors must provide external oilers for easy service.

Guide specifications (cont)

- 4. The fan motor shall be isolated from the fan housing by torsionally flexible isolation grommets. The fan and motor assembly must be capable of overcoming the external static pressures as shown on the schedule.
- 5. CFM/Static pressure rating of the unit shall be based on a wet coil and a clean filter in place.

D. Refrigerant Components:

- 1. Units shall have a sealed refrigerant circuit including a high efficient scroll, rotary or reciprocating compressor designed for heat pump operation.
- Units shall have a thermostatic expansion valve for refrigerant metering, an enhanced aluminum lanced fin and rifled copper tube refrigerant to air heat exchanger, a reversing valve, a coaxial (tube-in-tube) refrigerant-to-water heat exchanger.
- 3. Hermetic reciprocating compressors shall be internally sprung. The compressor will be mounted on external computer selected isolating springs. The external springs will be secured to rails that are isolated from the cabinet base. Compressor shall have thermal overload protection and be located in an insulated compartment away from airstream to minimize sound transmission.
- 4. Refrigerant-to-air heat exchangers shall utilize enhanced lanced aluminum fins and rifled copper tube construction rated to withstand 450 psig refrigerant working pressure.
- 5. Refrigerant-to-water heat exchangers shall be of copper inner-water tube and steel refrigerant outer tube design, rated to withstand 450 psig working refrigerant pressure and 450 psig working water pressure. Plate-to-plate heat exchangers cannot be used.
- Refrigerant metering shall be accomplished by thermostatic expansion valve only. Units intended for use in factory standard built operating range with entering water temperatures from 20 to 110 F.
- 7. Reversing valves shall be four-way solenoid activated refrigerant valves which shall fail to heating operation should the solenoid fail to function. If the reversing valve solenoid fails to cooling, a low temperature thermostat must be provided to prevent over-cooling an already cold room.
- 8. Optional cupro nickel coaxial water-to-refrigerant heat exchangers.
- Optional insulated water circuit for units operating with entering water temperatures below dew point.

E. Drain Pan:

The drain pan shall be constructed to inhibit corrosion and is fully insulated. Drain outlet shall be located on pan as to allow complete and unobstructed drainage of condensate. Vertical units will be supplied with factory-installed trap inside of cabinet. The unit as standard will be supplied with solid-state electronic condensate overflow protection. Mechanical float switches are not acceptable.

F. Filter

- 1. Units shall have a factory installed 1 in. wide filter bracket for filter removal from either side. Units shall have a 1 in. thick throwaway type fiberglass filter.
- 2. The contractor shall purchase one spare set of filters and replace factory shipped filters on completion of start-up.
- 3. Filters shall be standard sizes. If units utilize non-standard filter sizes then the contractor shall provide 12 spare filters for each unit.
- 4. Field installed 2 in. filter brackets and 2 in. fiberglass throwaway filters on all units can be installed by contractor.

G. High Static Blower:

Provides increased airflow at various static pressure conditions. Available in sizes 030 and 036 for 50RHS,RVS and in size 048 for 50RHR,RVR units.

H. High Water Temperature Switch:

Interrupts unit operation when leaving water temperature is above normal conditions.

I. Controls and Safeties:

1. Electrical:

- a. A control box shall be located within the unit compressor compartment and shall contain a 50 va transformer, 24-volt activated, 2 or 3 pole compressor contractor, terminal block for thermostat wiring and solid-state controller for complete unit operation. Electromechanical operation is not acceptable.
- Units shall be nameplated for use with timedelay fuses or HACR circuit breakers. Unit controls shall be 24-volt and provide heating or cooling as required by the remote thermostat/ sensor

2. Piping:

a. Supply and return water connections shall be copper FPT fittings and shall be securely mounted flush to the cabinet corner post allowing for connection to a flexible hose without the use of a back-up wrench.

b. All water connections and electrical knockouts must be in the compressor compartment corner post as to not interfere with the serviceability of unit. Contractor shall be responsible for any extra costs involved in the installation of units that do not have this feature.

3. Unit Controls:

- a. Safety controls including a high-pressure switch, a low-pressure sensor, and a low water and low air temperature sensor. Access fittings shall be factory installed on high and low pressure refrigerant lines to facilitate field service.
- b. Activation of any safety device shall prevent compressor operation via a lockout device. The lockout shall be reset at the thermostat or at the contractor-supplied disconnect switch.
- c. Units which may be reset only at the disconnect switch only shall not be acceptable.
- 4. The standard C control electronic control system shall interface with a heat pump (Y,O) wall thermostat (mechanical or electronic). The control system microprocessor board shall be specifically designed to protect against building electrical system noise contamination, EMI, and RFI interference. The control system shall have the following features:
 - a. Performance Monitor (PM). The PM warns when the heat pump is running inefficiently.
 - b. Anti-short cycle time delay on compressor operation time delay shall be 5 minutes minimum.
 - c. Random start on power up mode.
 - d. Low voltage protection.
 - e. High voltage protection.
 - f. Unit shutdown on high or low refrigerant pressures.
 - g. Unit shutdown on low water temperature.
 - h. Water coil freeze protection (selectable for water or antifreeze).
 - Air coil freeze protection (check filter switch).
 - j. Condensate overflow shutdown.
 - k. Option to reset unit at thermostat or disconnect. Fault type shall be retained in memory if reset at thermostat.
 - Automatic intelligent reset. Unit shall automatically reset 5 minutes after trip if the fault has cleared. Should a fault reoccur 3 times sequentially then permanent lockout will occur.
 - m. Ability to defeat time delays for servicing.

- n. Light-emitting diodes (LED) to indicate high pressure, low pressure, low voltage, high voltage, air/water freeze protection, condensate overflow and control status.
- The low-pressure switch SHALL NOT be monitored for the first 90 seconds after a compressor start command to prevent nuisance safety trips.
- p. Remote fault type indication at thermostat.
- q. Selectable 24-v or pilot duty dry contact alarm output.
- r. 24-v output to cycle a motorized water valve with compressor contractor.
- 5. Optional electronic D Control shall have all the features of the C control with the following additional features:
 - a. A removable thermostat connector.
 - b. Random start on return from night setback.
 - c. Intelligent reversing valve operation for extended life and quiet operation.
 - d. Night setback control from low temperature thermostat, with 2-hour override initiated by a momentary signal from the thermostat.
 - e. Dry contact night setback output for digital night setback thermostats.
 - f. Ability to work with heat/cool (Y, W) thermostats.
 - g. Ability to work with heat pump thermostats using O or B reversing valve control.
 - h. Single grounded wire to initiate night setback, or emergency shutdown.
 - Boilerless system control can switch automatically to electric heat at low loop water temperature.
 - j. Dehumidistat input providing fan control for dehumidification operating.
 - k. Multiple units connected to one sensor providing communication for up to 3 water source heat pumps.
 - l. Selection of boilerless changeover temperature set point.

J. Field-Installed Accessories:

1. Thermostat Controls:

- a. Programmable multi-stage thermostat with 7-day clock, holiday scheduling, large backlit display and remote sensor capability.
- b. Programmable 7-Day Light Activated Thermostat offers occupied comfort settings with lights on, unoccupied energy savings with lights off.
- c. Programmable 7-Day Flush Mount Thermostat offers locking coverplate with tamper proof screws, flush to wall mount, dual point with adjustable deadband, O or B terminal, and optional remote sensor.

Guide specifications (cont)

- d. Programmable 5-Day Thermostat offers 2 stage heat, 2 stage cool, auto changeover, 5-minute built-in compressor protection, locking cover included.
- e. Non-programmable Thermostat with 2 heat stages, 2 cool stages, auto changeover, 5-minute built-in compressor protection, locking cover included.
- 2. Loop Controller with six stages (2 stages for heating and 4 stages for heat rejection).
- 3. Filter Rack (2 in.) to enhance the filtration system of the water source heat pump. NOTE: Filter rack does not include filters.
- 4. Carrier Comfort Network (CCN) Controller.
- 5. Fire-Rated Hoses kits with a fixed MPT on one end and a swivel with an adapter on the other end. Hose kits can be either stainless steel or galvanized.

- 6. Ball Valves (Brass Body) for shut off and balancing water flow. Available with memory, with memory stop, and pressure temperature
- 7. Y Strainers (Bronze Body) "Y" type configuration with a brass cap. Maximum operating pressure rating of 450 psi. Strainer screen made of stainless steel.
- 8. Solenoid Valves (Brass Body) provides slow operation for guiet system application.
- 9. Hose Kit Assemblies includes a ported ball valve with pressure temperature (P/T) plug ports, flexible stainless steel hose with swivel and nipple. Return hose includes a ball valve, preset measure flow (gpm) with two P/T ports, flexible stainless steel hose with a swivel and nipple.
